

ABSTRACT

A method, system and apparatus for indicating input focus in a portal environment. A method for indicating user input focus in a portal environment can include assigning an unfocused style sheet to all unfocused portlets in a portal except for a focused portlet having input focus. A focused style sheet further can be assigned to the focused portlet having input focus. Subsequently, each of the focused and unfocused portlets can be rendered in the portal. Responsive to a new portlet in the portal acquiring the input focus from the focused portlet, the focused style sheet can be re-assigned to the new portlet while the unfocused style sheet can be re-assigned to the focused portlet which no longer has input focus. Subsequently, the new portlet and the focused portlet which no longer has input focus can be re-rendered in the portal according to the style sheets.
